pca_open_office

January 18, 2022

1 Principal Component Analysis

Below are the Principal Component Analysis on the first 7 features:

1. index: Index for each data point
2. sim: Index for each simulation
3. tem: Temperature of air supplied to the zone (°C)
4. mass: Total mass flow rate of air supply to the zone (kg/s)
5. n_occ: Number of occupants in zone
6. x: location of occupant of interest on x-axis (m)
7. y: location of occupant of interest on y-axis (m)

The last 3 features are treated as target predictions for evaluation purpose.

1. MRT: Mean radiant temperature of the occupant of interest's head and chest (°C)
2. T: Average temperature of air surrounding the occupant of interest (°C)
3. V: Average speed of air surrounding the occupant of interest occupant (°C)

[1]:
```
data_loc = '../data/preprocessed/'
```

1.1 Open Office

1.1.1 1. Standardize the data

[2]:
```
import pandas as pd
from sklearn.preprocessing import StandardScaler

open_office_data = pd.read_csv(data_loc+"open_office.csv")
open_office_data.isna().sum()
```

[2]:
```
index    0
sim      0
tem      0
mass     0
n        0
occ      0
x        0
y        0
MRT      0
T        0
```

```
V        8
dtype: int64
```

This dataset seems to have null values.

[3]:
```
# Remove the index column
open_office_data.drop(columns=['index', 'sim'], inplace=True)

# Remove null data
open_office_data = open_office_data.dropna()

# Seperate the data into features and labels
X = open_office_data.drop(columns=['MRT', 'T', 'V'])
y_MRT = open_office_data['MRT']
y_T = open_office_data['T']
y_V = open_office_data['V']

# Standardize the data
scaler = StandardScaler()
scaler.fit(X)

X_std = pd.DataFrame(scaler.transform(X), columns=X.columns)
X_std.describe()
```

[3]:
```
                tem          mass             n           occ             x  \

```

1.1.2 2. Perform PCA

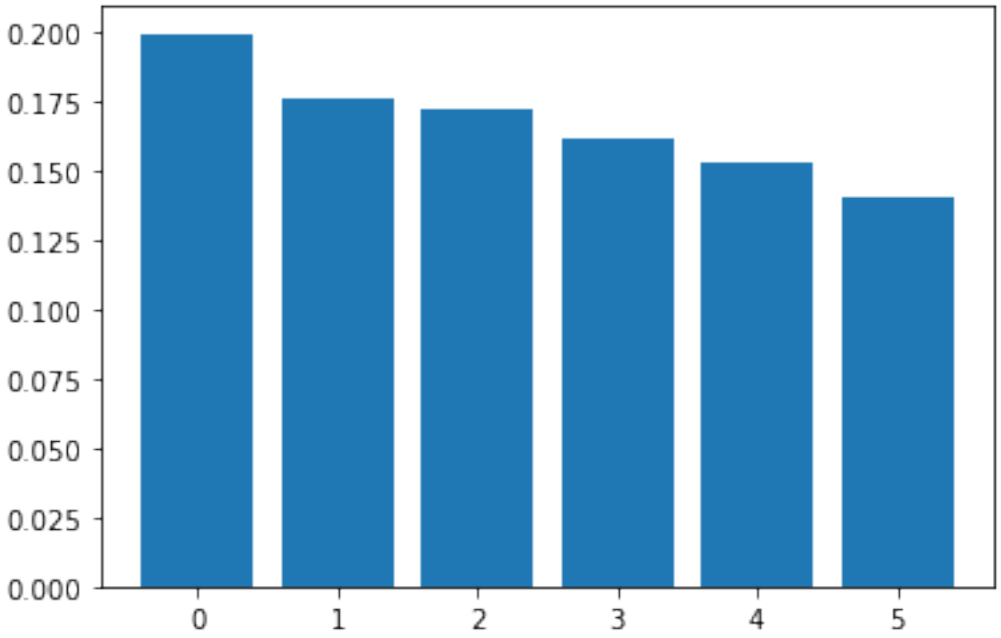
[4]:
```
# Perform PCA
from sklearn.decomposition import PCA
import matplotlib.pyplot as plt
import numpy as np
from numpy import savetxt

pca = PCA()
pca.fit(X_std)

e_vectors = pca.components_ # The eigenvectors
evr = pca.explained_variance_ratio_ # The variance explained by each eigenvector

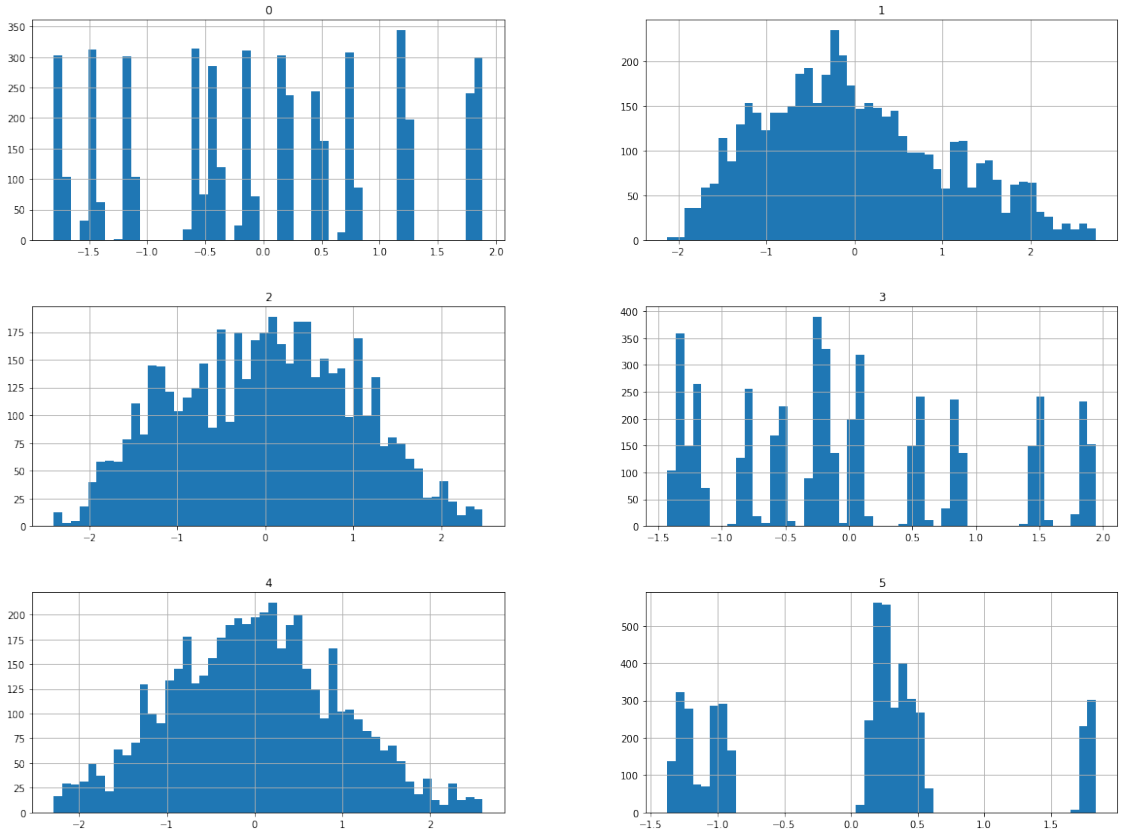
# Save the eigenvectors to a text file
savetxt("../reports/data/pca_open_office_eigenvectors.csv", e_vectors,␣
 ↪delimiter=',')

plt.bar(range(len(evr)), evr)
plt.savefig('../figures/evr_pca_open_office.png')
```



[5]:
```
# Tramsform the data
X_pca = pd.DataFrame(pca.transform(X_std))
fig, ax = plt.subplots(figsize=(20,15))
X_pca.hist(bins=50, ax=ax)
fig.savefig('../figures/hist_pca_open_office.png')
```

```
/tmp/ipykernel_21455/4076575879.py:4: UserWarning: To output multiple subplots,
the figure containing the passed axes is being cleared
  X_pca.hist(bins=50, ax=ax)
```



After performing PCA on the features, the distribution graph shows more normal distribution features (8 features).

1.1.3 3. Compare models' results with and without PCA on predicting MRT

3.1 Split the data into training and testing

[6]:
```
# Split the data into training and testing
from sklearn.model_selection import train_test_split

# Without PCA
X_train, X_test, y_train, y_test = train_test_split(X_std, y_MRT, test_size=0.
 ↪2, random_state=42)

# With PCA
X_train_pca, X_test_pca, y_train_pca, y_test_pca = train_test_split(X_pca,␣
 ↪y_MRT, test_size=0.2, random_state=42)
```

3.2 Train and evaluate the Linear Regression model

3.2.1 Without PCA

[7]:
```
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error
import pickle
import time

# Train linear regression model on training data
model = LinearRegression()
start = time.time()
model.fit(X_train, y_train)
stop = time.time()
lr_train_time = stop - start
print(f"Training time: {lr_train_time}s")

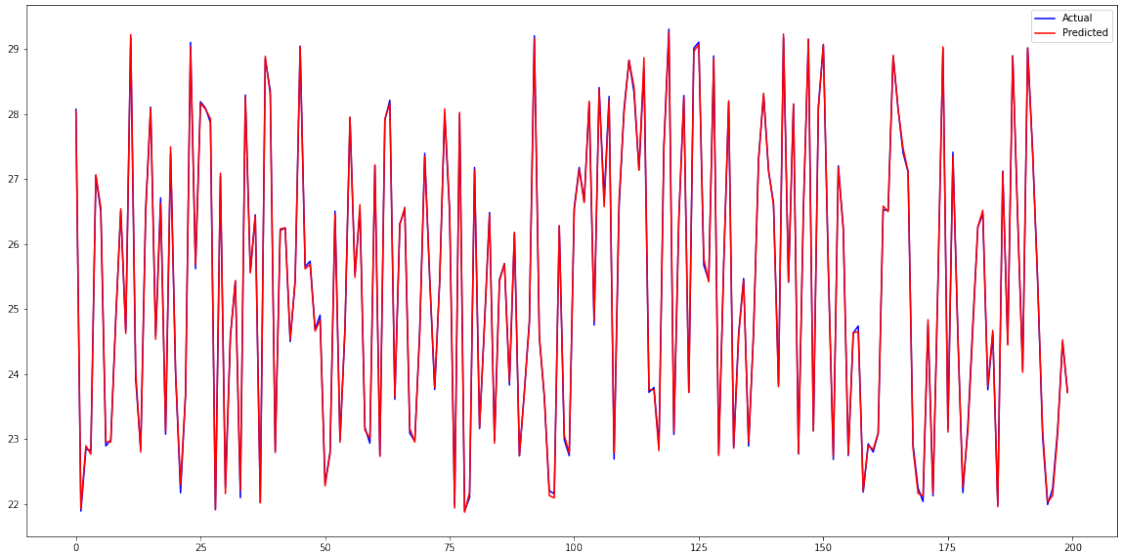
# Save the model to a pickle file
filename = '../reports/models/lr_MRT_open_office_model.pkl'
pickle.dump(model, open(filename, 'wb'))

# Predict on test data
y_pred = model.predict(X_test)

# Evaluate the model
mse = mean_squared_error(y_test, y_pred)
print(f'Mean squared error: {mse}')

# Plot the predictions and actual values
plt.figure(figsize=(20,10))
plt.plot(range(200), y_test[:200], color='blue', label='Actual')
plt.plot(range(200), y_pred[:200], color='red', label='Predicted')
plt.legend()
plt.show()
```

```
Training time: 0.005346536636352539s
Mean squared error: 0.002502969797609541
```



3.2.2 With PCA

[8]:
```
# Train linear regression model on training data
start = time.time()
model.fit(X_train_pca, y_train_pca)
stop = time.time()
lr_pca_train_time = stop - start
print(f"Training time: {lr_pca_train_time}s")

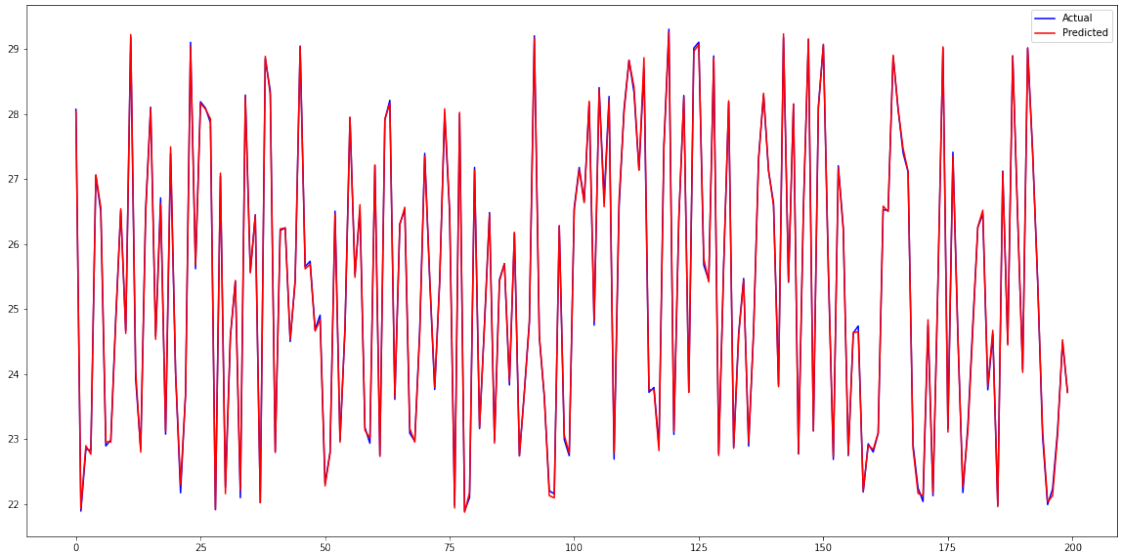
# Predict on test data
y_pred_pca = model.predict(X_test_pca)

# Save the model to a pickle file
filename = '../reports/models/lr_MRT_pca_open_office_model.pkl'
pickle.dump(model, open(filename, 'wb'))

# Evaluate the model
mse = mean_squared_error(y_test_pca, y_pred_pca)
print(f'Mean squared error: {mse}')

# Plot the predictions and actual values
plt.figure(figsize=(20,10))
plt.plot(range(200), y_test_pca[:200], color='blue', label='Actual')
plt.plot(range(200), y_pred_pca[:200], color='red', label='Predicted')
plt.legend()
plt.show()
```

```
Training time: 0.007262229919433594s
Mean squared error: 0.0025029697976095343
```



3.3 Train and evaluate the Feedforward Neural Network model

3.2.1 Without PCA

[9]:
```
# Create neural network model
from keras.models import Sequential
from keras.layers import Dense

N_NEURONS = 1024
N_LAYERS = 4

model = Sequential()
model.add(Dense(units=N_NEURONS, input_dim=X.shape[1], activation='relu'))
for i in range(N_LAYERS-1):
    model.add(Dense(units=N_NEURONS, activation='relu'))
model.add(Dense(units=1, activation='linear')) # Output layer
model.compile(loss='mean_squared_error', optimizer='adam')

# Train the model
start = time.time()
model.fit(X_train, y_train, epochs=100, verbose=0)
stop = time.time()
nn_train_time = stop - start
print(f"Training time: {nn_train_time}s")

# Predict on test data
y_pred_nn = model.predict(X_test)
model.save('../reports/models/nn_MRT_open_office_model.pkl')
```

```python
# Evaluate the model
mse = mean_squared_error(y_test, y_pred_nn)
print(f'Mean squared error: {mse}')

# Plot the predictions and actual values
plt.figure(figsize=(20,10))
plt.plot(range(200), y_test[:200], color='blue', label='Actual')
plt.plot(range(200), y_pred_nn[:200], color='red', label='Predicted')
plt.legend()
plt.show()
```

```
